

IntelliFill™ i.v.

Human Intelligence, Robotic Performance

Trisha Fronczek, RN, BSN
Professional Development Coordinator

University of Maryland Medical Center (UMMC)
Baltimore, Maryland, April 2007

- One of the nation's oldest teaching hospitals
- Provides a full spectrum of services with a renowned Trauma and Emergency Services Program
- 669-bed facility located in downtown Baltimore
- Known for one of the world's largest kidney transplant programs
- Installed ForHealth's IntelliFill i.v. in Q2 2005
 - Initially went live in the Adult Trauma/Emergency Services Department
 - Currently producing IntelliFill syringes for Adult Acute Care, Adult Critical Care, and Operating Services
 - At the time, Trisha Fronczek was the Clinical Education Specialist; she has since been promoted to Professional Development Coordinator

The benefits of syringe infusion:

"Syringe administration is a much easier process for both the patient and the clinician. Syringe infusion provides nursing the flexibility to administer meds using either IV push or by infusing the syringe as a piggyback using an IV pump. It also takes a lot less time and results in less waste because of the smaller volumes."

Testimonial

Controlling fluids:

“Controlling fluids is an important aspect of care. One of the benefits of the IntelliFill syringes is that we can infuse smaller amounts of fluids with less concern about fluid-overloading the patient.”

ForHealth’s support team accommodating and knowledgeable:

“ForHealth’s team is very flexible. During implementation, they were here days, nights and weekends. They even came in on all the off-shifts. So, we felt very secure and received solid training. On the administration side, they were well versed in the use of our pumps because of other customer implementations, and they were very knowledgeable about our medication regimens including dosages and standard concentrations.”

Ease of implementation and careful planning provided valuable data:

“We started in our adult trauma area, which comprises an ICU, IMC, and step-down units, and used a broad-spectrum generic drug that could be IV pushed or given with an infusion pump. ForHealth worked with us as a team to differentiate the practice patterns and anticipate training requirements related to our specific needs and desires.”

Call ForHealth Technologies at 888-434-8462 and ask for the Sales Manager in your area.
